

Divyani Portfolio Build / Portfolio sitemap review for internship applications ▾

I am creating a portfolio for AI/ML and Software Development internship opportunities.

My portfolio has the following sitemap:

Home

Please review this sitemap.

Specifically:

1. Is it simple and easy to navigate?
2. Does every page support my goal of getting internships?
3. Should I remove or add any pages?
4. Suggest one improvement that would make my portfolio stronger for recruiters.

Sitemap Review — Portfolio Mentor Notes

Let's go through this like we're prepping for a recruiter's first 30-second scan of your site, because that's really what a student portfolio has to survive.

1. Is it simple and easy to navigate?

Mostly yes. Five top-level items is a good number — recruiters won't get lost. But there's one structural issue: **"Case Studies" and "Projects" are competing for the same purpose.**

Think about it from a recruiter's perspective: they click "Projects," see your three projects listed. Then they see "Case Studies" as a separate nav item and think — wait, is this different content, or the same projects explained again? That ambiguity costs you attention, and attention is the scarcest resource in a 30-second scan.

Tutor explanation: In UX, this is called *navigation redundancy* — two menu items that a first-time visitor can't distinguish without clicking both. Every extra click is a chance for the recruiter to give up and move to the next candidate's tab.

2. Does every page support your internship goal?

Let's audit each one:

Page	Recruiter value	Verdict
Home	High — first impression, sets expectations	Keep
Projects (list)	High — this is the core evidence of skill	Keep
Individual project pages	High, <i>if</i> each shows problem→approach→result	Keep, but strengthen (see below)
Case Studies	Unclear — likely overlaps with Projects	Merge or remove
About Me	Medium — recruiters skim this for fit/story	Keep, keep short
Contact	High — this is the conversion point	Keep

3. Should you remove or add pages?

Remove/Merge: Fold "Case Studies" into your Projects section. Instead of two separate pages, make each **individual project page itself a mini case study** — Problem → Your Approach → Tech Stack → Result/Metric → Link to code/demo. This is strictly better than a separate "Case Studies" page because recruiters see the depth *exactly where they're already looking*, with no extra navigation.

Add: A **Resume/Skills snapshot** isn't in your sitemap. Many recruiters want a fast, scannable list of your tech stack (Python, React, MongoDB, ML, DSA, OS) before they read project details — either as a section on Home or a dedicated line item. Don't bury this only inside "About Me" prose.

Revised sitemap:

```

Home (with skills snapshot + resume download)
├── Projects
│   ├── HerDesignScanner (as case study: problem → approach → result)
│   ├── Ticket Booking System (same structure)
│   └── PSIT Digital Campus Navigation Map (same structure)
├── About Me
└── Contact
  
```

4. One improvement that would make it stronger for recruiters

Add a one-line "impact metric" to every project card on the Projects listing page — before the recruiter even clicks in.

Example difference:

- Weak: "Ticket Booking System — MERN stack project"
- Strong: "Ticket Booking System — MERN app handling seat selection & booking flow, reducing manual booking steps by [X]%"

Why this matters (the tutoring part): Recruiters screening dozens of portfolios don't read — they *scan for signal*. A specific number or outcome instantly reads as "this person understands impact, not just syntax," which is exactly the maturity signal that separates a shortlisted resume from a skipped one. Even an estimated or approximate metric (clearly labeled as such) is more credible than a vague tech-stack list.

Your action items:

1. Merge Case Studies into Projects (restructure each project page with Problem → Approach → Result format)
2. Add a skills snapshot to Home
3. Write one impact metric per project for the listing page

Want me to help you draft the Problem → Approach → Result structure for HerDesignScanner first, since it's your strongest AI/ML signal for those internships?
